

Phase 1

Brainstorming & Ideation Phase

Phase 1: Brainstorming & Ideation Phase

Background

Alex is a travel enthusiast who frequently visits different cities and needs a streamlined way to track local weather conditions and receive AI-driven activity suggestions based on current forecasts.

Problem

- Difficulty tracking and managing multiple favorite weather locations efficiently.
- Lack of personalized recommendations for outdoor activities or clothing.
- Need for natural language weather summaries rather than just raw data metrics.
- Absence of a secure system to store and sync preferences across devices.

Solution

The AI WeatherWise provides a centralized service that handles weather data retrieval and AI orchestrations. It manages a secure User and Location database, allowing for customized insights and automated recommendation workflows through Google Gemini.

Usage

- **User Usage:** Manages favorite cities (CRUD), fetches real-time weather, and requests AI insights for recommendations and summaries.
- **Developer/Admin Usage:** Monitors API health, manages global user registrations, and verifies weather/AI service integrations.
- **Weather Application User:** Interfaces with the public weather endpoints to consume current metrics without requiring an account.

Outcome

By leveraging AI and centralized data management, users spend less time deciphering raw metrics. The system ensures data integrity via Mongoose schemas and provides high-value, context-aware weather advice through Gemini integrations.
